

## INSTRUCTIONS FOR CONVENTIONAL VARIETIES

### 01 OPEN THE SEAL

Use sanitary gloves to handle your grow kit, remember that we are going to deal with a very delicate living being, you must have an environment that is as septic as possible, treat it with respect. Put the security seal and continue with the next point

### 02 REMOVE THE COVER

The next step is to open the lid completely so that the Grow Kit takes oxygen for the first time, for one minute, thus the fruiting process begins. You already know that you have to keep the Grow Kit in the best conditions so that it bears fruit correctly and properly. It is important that you follow these instructions step by step. Continue on the next point.

### 03 SEAL IT AGAIN

This step is crucial! You must put the lid back on to close the kit, making sure to close it in the indicated parts, clicking when closing it, you will notice it. You must do it in all the marked points, the corners, in the middle of each side and the only one that you should not press is in the corner where you opened it, thus leaving a slight inlet of air that will be enough to properly oxygenate your Grow Kit.

Remember This is one of the most important steps. If you do not close all the points correctly, you will leave a larger opening, exposing the kit to greater moisture evaporation and a worse harvest. The opening between the lid and the plastic container should not be larger. of Imm.

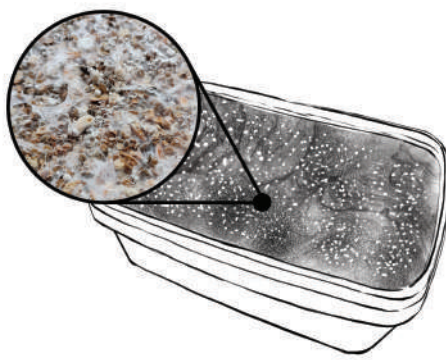

**REMEMBER THAT THIS IS EXTREMELY IMPORTANT, IF YOU DO NOT SEAL YOUR KIT CORRECTLY, IT MAY GET DRY! SO THE MUSHROOMS MAY NOT DEVELOP AND FRUIT.**

**ALSO REMEMBER TO KEEP YOUR GROW KIT AT A TEMPERATURE BETWEEN 21 AND 30 DEGREES, BEING 23 THE IDEAL TEMPERATURE, WITH AMBIENT LIGHT OR INDIRECT LIGHT, AWAY FROM ANY STRONG HEAT SOURCE, AND OUT OF THE BAG, YOU HAVE HEARD RIGHT, OUT OF THE BAG, ONLY TATANDI MAKES IT SO EASY FOR YOU.**

### 04 AIR DAILY

The Grow Kit is already underway, now we must wait for the first pins/primordia. We can open the lid daily to give the Grow Kit more oxygen, one minute will be enough, incidentally observe if it has begun to bear fruit. Remember to wash your hands.

When you see that there are already a lot of pins, it's time to move on to the next step.

### 05 THE PINES ARRIVED!

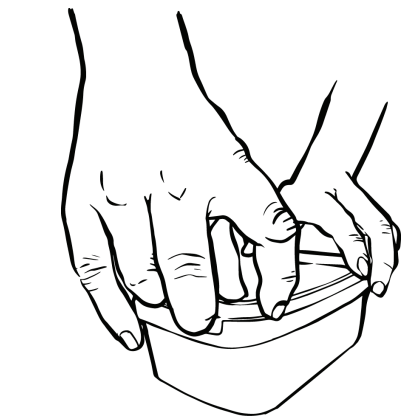

This is the point we have to reach before we put it in the bag, the Grow Kit is fully colonized and full of pins.

The pines or primordia are like "baby mushrooms" it is the first stage of their growth and indicates that they are beginning to develop. For this reason, at this point we must go on to fruit in the bag **WITHOUT THE LID, SAVE IT FOR LATER YOU WILL NEED IT**, where space and humidity conditions exist so that they continue to grow.

### BACK TO THE BAG

Congratulations! It is time to put your grow kit in the bag, you are already very close to the harvest, before putting it in it is advisable to put on gloves and disinfect them with sanitary alcohol.

Spray the walls of the bag and put your kit in it, then you can spray the walls of the bag to generate humidity twice a day, this is optional, but if you live in a dry place it is more recommended than if you live in humid areas.

### KEEP IN MIND

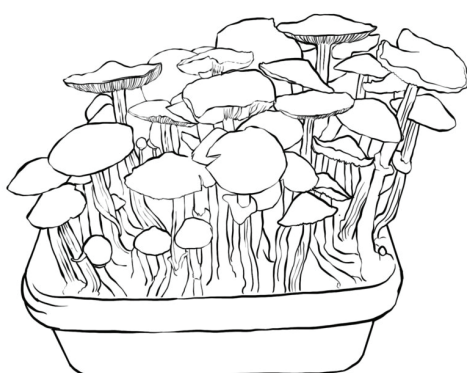

It is very important that the Grow Kit "breathe" since, for proper fruiting, a balance between ventilation and humidity must be maintained. Once you introduce your Grow Kit in the greenhouse bag, **NEVER FULLY CLOSE** the zip of the bag, you must leave 1/3 open as indicated in the image so that the primordia can develop.

As soon as you see that they begin to turn into mushrooms, you must open the zip 2/3 of their opening. Each place has different temperatures and humidity, so you must ensure that the greenhouse bag always maintains humidity. If your environmental humidity is too low, it is advisable to check the water inside the bag, so that it does not decrease too much or otherwise if it creates too much humidity, you can open the zip a little more. If you see that the walls are drying, you can spray with a very fine spray.

Another method to see if your Grow Kit is drying out too much is to illuminate it with the mobile flashlight, if you do not see microdrops shining on the surface, it is recommended that you spray the surface very finely from a meter away and never directly, so that the microdroplets fall by gravity on the surface of the kit, as if it were a natural dew. Now to wait for your harvest! When the mushrooms develop, you should keep watching until the veil begins to come off the cap, this is the optimal point for harvesting, since in this state it reaches optimal maturity and weight.

### TIME TO AWAIT YOUR HARVEST!

When the mushrooms develop, you should keep watching until the veil begins to come off the cap, this is the optimal point for harvesting, since in this state it reaches optimal maturity and weight.

**CONGRATULATIONS ON THE HARVEST! HARVEST YOUR FRUITS CAREFULLY BY TURNING THE FRUIT UNTIL IT IS CAREFULLY DETACHED FROM THE GROW KIT. ALWAYS DO IT WITH GLOVES TO AVOID CONTAMINATION**

Now is the time to fruit it again, fill your Grow Kit with tap water to the brim, put the lid on and wait 20 minutes always outside the fridge, then pour all the water until there is nothing left in the Grow Kit and start the process from point 4 or follow the steps of the premium instructions from point 9, this is the most recommended and fastest, but it is more difficult.
